# Pure Blonde™

Liriope Muscari 'LIRBLONDE' 

Jan-Feb  Mar-Oct

Pure Blonde turns mostly green in summer

## Stunning blonde foliage in spring.

How can this be? Is the plant sick? Will it live? It is not sick, and it is very tough. It's a freak of nature. If you cut this plant back to the ground in July, it will re-shoot pure blonde in August to September depending on where you live. The colour contrast is amazing. Imagine it amongst Black mondo. The key to this plant is that it stays blonde for about 2 months in spring, then it slowly turns green, which creates beautiful contrasts of colours on its own.

By Summer it is often mainly green, which helps it do well in the hot summer. In autumn you often get new greenish blonde shoots. By July again it is time to cut back all the foliage to get ready for the spring time Pure Blonde. If it is grown in full sun and re-shoots in the sun, there is rarely any burning, particularly in the second year. By the time it is summer, Pure Blonde is green. If you move it from shade to sun it may burn. The foliage on Pure Blonde is more interesting than white flowering plants. It is a true traffic stopper and tough enough to grow almost anywhere in Australia, including humid North Queensland and cold Canberra.

# Blondes have more fun

FOLIAGE FIRST RANGE

DESCRIPTION	Clumping plant, white foliage in spring
HEIGHT & WIDTH	30 cm x 40 cm
POSITION	Full sun to heavy shade
CARE	Cut back each July
USES	Feature plant, groundcover
SOIL TYPE	Sandy to clay soil types
